New National Blueprint Outlines Malnutrition Strategies for Action Across Healthcare Continuum

Citing alarming statistics that show that nearly 1 of every 2 older Americans is at risk of malnutrition and that disease-associated malnutrition in older adults is estimated to cost $51.3 billion annually, a broad group of advocates has laid out and just released a roadmap for a new national effort to help millions of Americans who suffer from malnutrition or could be at risk as they grow older. The first ever National Blueprint: Achieving Quality Malnutrition Care for Older Adults calls for a range of strategies to be implemented across the healthcare institution and community spectrum, with four primary goals: improving quality care practices, improving access, generating research, and advancing public health.

“This National Blueprint is one of the most comprehensive approaches taken to date to address malnutrition and older adults.”

“We want it to be a pathway toward raising greater public awareness and the catalyst to prompt establishing national goals and improving access to high quality malnutrition care and nutrition services.” said Bob Blancato, Chair, American Society on Aging, and National Coordinator, Defeat Malnutrition Today.

One of the Blueprint’s real strengths is that it offers implementation-ready recommendations for acute-care, post-acute care, and community organizations.

The Blueprint cites the need for best practice standards and screening tools to be “systematically adopted into routine quality medical care or adopted across care settings.” Currently, the Centers for Medicare and Medicaid Services (CMS) does not include malnutrition care in healthcare quality incentive programs or require healthcare providers to report malnutrition as a key health indicator for older adults.
